1. EXECUTIVE SUMMARY

A QUICK OVERVIEW

GENERAL MARKET FRAMEWORK

- The NYSE Arca Global Airline Index is a modified equal-dollar weighted index designed to measure the performance of highly capitalized and liquid international airline companies.
- The Index tracks the price performance of selected global market leaders of major USA and overseas airlines

KEY FIGURES

LATAM RELATIVE POSITIONING

VALUATION

2. COMPANY & MARKET OVERVIEW

A STORY OF SUCCESS IN SOUTH AMERICA

EQUITY STORY

A HYBRID BUSINESS MODEL

LATAM business model can be identified as a hybrid model between a Full-Service Airline (FSA) and a Low Cost Carrier (LCC)

FSA FEATURES

- ✓ Largest Frequent Flyer programme in Latin America (39M members)
- ✓ Services differentiation (seats, flexibility to cancel/change flight)
- ✓ #1 in Punctuality (OTP) globally in Mega Airlines category
- ✓ Leader in frequency in 60% of its routes
- ✓ Strategic alliances result in a more complex but complementary network of connections

LCC FEATURES

- ✓ 1st company in Latin America to obtain the platinum certificate under IATA Fast Travel (>80% check-in with self service)
- ✓ Single type Airline (the Narrow-body A320 Family comprises 80% of the fleet)
- ✓ Low cost base (targeted offerings to enable capacity at a marginal cost, dynamic pricing for non-ticket redemption, optimal promotion price)

CARGO REVENUES

The graph shows the historical trend of Revenues/ATK and the percentage of ATK made by Boeing 767-300F (Latam cargo dedicated airplanes). More profitability is associated with more cargos employed

⁽¹⁾Corporate debt securities structured through SPVs

AIRLINE INDUSTRY OUTLOOK

MARKET EVOLUTION

Pre-Covid

- Air transport has always contributed to global economic development for two reasons:
 - Rise in connectivity between countries
 - Long-term decline in real air transports costs
- The airline industry has historically been a low return sector, with an overall return on capital well behind the threshold of 7%, creating an *empty core value chain*
- System-wide global commercial airlines market accounted 838 billion of dollars in 2019, coming from a 5.3% CAGR in the period 2009-2019

Post-Covid

- The outbreak of Sars-Cov 2 caused a market contraction of 54.4%, causing the market to collapse to a value of 382 billion of dollars
- In 2021 the value of the market recovered to 471.8 billion
- The war in Ukraine and the (partially related) cost pressures of fuel and oil contributed to the global rise in inflation and subsequent decisions of central banks' monetary policies
- Global RPKs are forecasted to remain below their pre-pandemic 2019 level *until 2024*

The «global wealth-transfer» value chain is experiencing extensive changes:

EXTERNAL

INTERNAL

GLOBAL REVENUE COMPOSITION (2016-2021)

- Despite the relevant percentage shift from passenger (-30%) to cargo revenues (+29%) in the past 6 years in the airline sector, Latam maintained a strong emphasis on passenger revenues (65% in 2021)
- The development of the «Cargo-based» business model is partially correlated with the severe flight restrictions due to the pandemic
- Public sector support inevitably contributed to the high resilience of the market

GLOBAL WACC & ROIC IN AIRLINE COMPANIES (2008-2022)

- In any industry, investors expect to earn at least the increment in value generated by comparable assets with similar risk
- In the airline industry, while debt providers have been rewarded for their investments (debt was secured by company-owned assets), equity providers have not received adequate reward for their risk exposure

3. FINANCIAL STATEMENTS RECLASSIFICATION

BALANCE SHEET

Year ended December 31,	2021	2020	2019	2018	2017	Year ended December 31,	2021	2020	2019	2018	2017

"Held for sale" Liabilities	-	-	-	-	(15.5)						
Net non-current assets (or disposal groups)	146.8	276.1	485.2	5.8	275.6						
Net Invested Capital + Net Surplus Assets	2,288.4	6,721.3	12,472.7	12,512.7	11,031.7						

- Airline Companies usually have negative working capital, as their cash conversion cycle is negative: they collect revenues in a short-time window (LATAM DSO < 55 days in 2021) if not in advance and pay suppliers with longer deadlines (LATAM DPO > 370 days in 2021)
- The decrease in Net Working capital during 2020 and 2021 results from the slow down in revenues due to travel restrictions, and the increase in account payables, due to renegotiations of payment deadlines with suppliers, following Chapter 11 Proceedings (Notes 8,20 -2021)
- In 2020, the company recognized an impairment for the total goodwill due to 1) increase in uncertainty, 2) increase in market interest rates, 3) fall in share price and 4) decrease in operations (Note 16 - 2020). PP&E and non-current financial liabilities decreased considerably in 2020 and 2021, due to the impossibility to lease aircrafts (derecognition of the assets and the liabilities associated with these aircrafts, Note 17 -2021)
- Equity Book Value is negative since retained losses, cumulated during 2020 and 2021, offset the amount of share capital (*Statement of changes in equity - 2021*)

(1) 35% classified as "resignation payments" and "other obligations": not interest-bearing, thus operating liabilities. 65% classified as "retirement payments": assumed to be invested in pension plans, thus financial liabilities.

Net income (loss) for the year	(4,653.1)	(4,555.5)	195.6	341.8	154.4						

- Operating revenues (from passenger transport) decreased in 2020 and 2021 by 70% and 63% compared to 2019 respectively, due to travel restrictions. Conversely Cargo revenues increased, as demand soared: *by converting passenger planes into air freighters, Latam plans to increase its capacity by 80% within 2023*
- Variable operating costs, such as fuel and commissions, decreased with the drop in revenues, although less than proportionally. However, the burden of fixed operating expenses led to a fast depletion of Value Added: -83% in 2020 and -72% in 2021, respect to 2019
- Despite the sizeable reduction of more than 40% of personnel expenses, resulting from restructuring activities, EBITDA was negative in 2020 and extremely weak in 2021. Latam incurred in severe operating losses in 2020 and 2021 (D&A > 20% of the total cost structure)
- Filing for Ch.11 in 2020, financial costs grew by 37% in 2021, mainly driven by bank loan interests (Note 27 -2021). Due to the suspension of operations in 2020 caused by Sars-Cov-2, Latam recognized an impairment loss for the entire Goodwill on balance, which worsened its Gross Operating Profit in 2020 (Note 16 - 2020)
- In 2021 restructuring costs were primarily made by rejection of aircraft lease contracts. In accordance with bankruptcy rules, Latam rejected some unexpired aircraft and engine leases and derecognized these assets, resulting in *losses for the value of the assets exceeding the lease liabilities and not yet amortized* (Note 2 - 2021)
- Already threatened by the tough competition and the value chain structure, Latam levered profit margins dropped from a weak 1.4% in 2019 to -95% in 2020 and -34% in 2021, *as revenues were far from full recovery and extraordinary costs expanded*

CASH FLOW STATEMENT

Year ended December 31,	2021	2020	2019
Data in US\$ millions, except per share and capital stock			
Cash Flow From Operations			
(+) Net income (loss) to parent's shareholders	(4,647.5)	(4,545.9)	190.4
(+) Non cash expenses: Total D&A	1,165.4	1,389.4	1,470.0
(-) Change in Net Operating Workign Capital (1)	3,068.9	278.7	963.6
(=) Cash Flow From Operations	(413.2)	(2,877.8)	2,624.0
Investing activities			
(-) Net Capital Expenditure for Fixed Assets	102.7	3,411.2	(1,810.5)
(+) Disposals of asset and groups held for sale (2)	129.3	209.0	(479.4)
(-) Investments in financial assets	(33.4)	463.0	(103.7)
(=) Capital Expenditure	198.6	4,083.3	(2,393.6)
Financing activities

(+) Change in debt financing	(457.4)	443.5	262.3
(+) Change in common equity financing (4)	26.7	(1,020.6)	(363.2)
(+) Change in Non-controlling interests	(3.7)	(5.1)	(81.5)
(=) Cash flow from financing activities	(434.4)	(582.2)	(239.5)
Delta cash balance	(649.0)	623.3	(9.1)

Levered-up by **strong & negative WC**

Influenced by **decrease in aircraft leases**

Two main drivers: **1) Debt financing & 2) Share repurchases**

- (1) Assuming no required cash and assuming Employees benefits are part of operating liabilities
- (2) Net of cash flows from liabilities for groups held for sale
- (3) Statement of changes in shareholder's equity: total transaction with shareholders
- (4) Common equity financing is assumed to be Total Equity to parent's shareholders net of income and dividends

- Being a large corporation with investments in multiple countries, Latam has unrealized gains and losses on assets reported as other comprehensive income (i.e., cash incomes or losses, such as gains on currency translation, cash flow hedges and gains by new measurement on defined benefit plans. These items are considered in computing the statement of cash flow
- The main non-cash expense is D&A. *Changes in Net Operating working capital are calculated assuming no cash is required to run the operations*, as Latam reports hedge derivatives as Other current financial assets (Note 7) - included in Working Capital
- The decrease in Net Working Capital in 2021 fiscal year was partially due to the recovery of air passenger operations (Latam has a negative cash conversion cycle). However, the *drop in Working Capital was extraordinary* even if compared to a "normal year" as 2019. The main drivers are Accrued liabilities, especially for aircraft, engine maintenance and fleet claims associated with the negotiations caused by Chapter 11 proceedings (Note 20)
- Restructuring activities through accrued liability management helped to absorb most of the cash loss arising from comprehensive income, resulting in a negative Levered cash flow from operations, which is less than 10% of the operating outflow in 2020
- In 2020, due to the process of Chapter 11, 29 aircraft lease contracts were rejected, which generated a relevant cash inflow for the investing activities and an outflow for financing activities (Note 17, 19)
- Total transactions with shareholders include mainly dividends and share repurchases. Cash flow from debt financing is positive in 2020, for the large amount of bank loans raised together with Chapter 11 process, whereas it is negative in 2021 due to further aircraft lease rejections (Note 19).
- The change in cash balance was negative in 2021, as divestitures cannot cover cash absorption by operating and financing activities, while in 2020 inflows from investing activities together with increased debt financing offset outflows from operations (Cash balance > 0).

PASSENGER FLIGHTS

- i. Brazil: Regressed quarterly $\ln(RPKs)$ over quarterly $\ln(Y_{t-1})$, where Y is the real GDP, and $\ln(Jet\ Fuel\ Price_{t-1})$ to find elasticities $\epsilon_1 = 3.62$, $\epsilon_2 = -0.19$. Since the time series are cointegrated and the model fit correctly the data ($R^2 = 0.963$), this model is employed to forecast total RPKs for Brazil with the following estimates:

- i. Real GDP Brazil = 1% growth rate
ii. Jet Fuel estimates below (Jet Fuel \$ per Gallon Table)

- ii. SSC: Regressed yearly $\ln(Number\ of\ Passengers)$ over yearly $\ln(Y_t)$, where Y is the real GDP of SSC, and over $\ln(Jet\ Fuel\ Price_t)$ to find elasticities: $\epsilon_1 = 2.44$, $\epsilon_2 = -0.35$. Since the time series are cointegrated and the model fit correctly the data ($R^2 = 0.984$) this model is employed to forecast total passengers for SSC with the following estimates:

- i. Real GDP SSC = 1% growth rate
ii. Jet Fuel estimates below (Jet Fuel \$ per Gallon Table)

- iii. International: Due to the uncertainty of the estimate, a 2,7% CAGR (2019-2028) is applied (as in [industry reports \(IATA\)](#) and [LATAM updated Business plan \(August 2022\)](#)) to the number of passengers. We forecast full recovery of the international sector in 2023, due to:

- i. Travel restriction are lifted by 2023
ii. A structural { ... }

Jet fuel \$ per Gallon

	2019	2020	2021	2022E	2023F	2024F	2025F	2026F	2027F
	1.86	1.1	1.69	3.43	3.1	2.38	2.38	2.38	2.38

TRENDS

Key ratios implied by the models – market figures	Brazil	SSC	International
Market recovery rate 2019 (pre-pandemic) vs. 2022	97.87%	104.88%	68.75%
CAGR 2022-2027, 5 years	4.70%	5.13%	15.59%
CAGR 8 years 2019-2028, Company's Estimate	4.10%	4.10%	4.10%
CAGR 8 years 2019-2028, own estimates	3.35%	3.79%	4.47%

REVENUE BREAKDOWN (2/2)

1.b) MARKET SHARES

- Brazil:** assuming Latam and its LCC Brazilian competitors will keep their actual RPKs as of 2021 (they operate in slightly different segments), *their future market share will be driven by their contribution to the market growth*. This contribution is estimated by a **backward-looking smoothed average**, reduced by a **future competition factor**
- Spanish Speaking Countries:** assuming Latam, Avianca and their LCC competitors will keep their actual Number of Passengers as of 2021 (they partially differ in value proposition) *their future market share will be driven by their contribution to the market growth*. This contribution is estimated by a **backward-looking smoothed average**
- International:** assuming Latam will benefit from the Joint Venture with Delta (*it is the first mover to propose such a close alliance and shares with Delta, an extremely affine airlines' value proposition*), Latam is expected to **gain a total of 7% of the International South American Market** within **2025**. Eventually, LATAM will stabilize due to the rise of the new LCC group Abra and other alliances between North and South American airlines

CARGO TRANSPORT: ATK and YIELD per ATK

- LATAM will expand its cargo-dedicated fleet its capacity by nearly 80% within 2023, due to the roaring export of Latin America countries (+53%), caused by the appreciation of the dollar
- Since 2021, Air cargo has temporarily benefited from a significant price advantage over maritime cargo (fees have risen more sharply because of the "container shortage" worldwide).
- Regressed the future Yield per ATK using the forward price of fuel and the expected mix of cargo that, according to the fleet declared by LATAM, will be 35% and 65% in 2027 respectively

REVENUE FORECASTS

USD mln	2022E	2023F	2024F	2025F	2026F	2027F
Latam BP	9,655	11,458	11,407	12,252	13,069	13,853
Own estimates	9,612	11,304	12,024	12,434	12,826	13,476

- Brazil:** yield per RPKs is considered constant in real terms and has been set to the mean level of 2019-2017. Brazil revenues have been estimated in local currency (R\$) and then converted using futures over the exchange rate
- SSC:** average real price per passenger linearly increase from 108.98 (2019) to 117.38, a median value between 2019 and 2021. Year 2020 has been excluded since travel restrictions affected the significance of this metric
- International:** International average price per passenger exponentially decrease till 2025 where, due to the increase in volumes of sales, stabilizes to 172.8 (2019 value)

Revenues forecasted breakdown (in USD millions)

The percentage revenues represented by the international market in 2022 is expected to be 28% of total revenues, due to the slow recovery of the international market

COSTS & REINVESTMENT NEEDS FORECAST

COST FORECASTS

USD mln	2022E	2023F	2024F	2025F	2026F	2027F
Latam BP	9,866	10,815	10,372	10,955	11,519	12,171
Own estimates	10,076	10,902	10,609	10,953	11,531	11,869

Every cost item is calculated according to specific assumptions:

- **Wages and benefits:** 2022 value = 73% of 2019 value; then (Volume of sales XXX year)/(Volume of sales 2022)
- **Aircraft Fuel:** (Volume of sales XXX year)/(Volume of sales 2019)*(Jet prices of XXX year)/Jet prices 2019)
- **Selling Expenses, Aircraft rentals, Passengers services, Other rentals and landing fees** driven by the volume of sales
- **Depreciation and amortization:** With the P.P.E. schedule and declared coefficients of depreciation and amortization (*Integrated Report 2021, Note 15-16*)
- **General expenses:** constant in real terms
- **Administrative expenses:** High variability in time series analysis; now at 59.7% of pre Sars-Cov-2 outbreak level. Considered to gradually ramp up proportionally to sales

Costs % on revenues – 2022 vs 2027

Base 2022
Page 24/27

CAPEX

Item (US\$ Millions)	2022E	2023F	2024F	2025F	2026F	2027F
Construction in progress	474	474	474	474	474	474
Land	43	43	43	43	43	43
Buildings	60	60	60	60	60	60

Lesenoid improvements	133	133	133	133	133	133
Subtotal PPE	7,215	7,226	7,239	7,244	7,247	7,251
ROU and other assets	2,189	2,884	2,903	3,170	3,404	3,848
Total	9,404	10,110	10,142	10,414	10,651	11,100

To compute **capex** and **depreciation** we estimated the **P.P.E. schedule**

- Some items are considered fixed in terms of net carrying amount, while others have a varying net carrying amount that moves along with the volumes of sales
- LATAM asserts that new aircrafts will be acquired only as R.O.U. Since the **non-cash fleet capex** is declared (*Updated Business Plan, August 2022*) and there is a precommitment on sales of aircrafts to be received between 2022 and 2029 (*Integrated Report 2021 - Note 16*), the computations are performed according to the **Company's declared acquisition program of ROU**, while spare parts and capitalizations of extraordinary maintenance (e.g., Cabin retrofit in 2024) have been considered in P.P.E

GENERAL COMMENT

Income Statement

Mainly due to an incomplete rebound of international air travel, Revenues in 2022 are still lower than Operating costs, leading to a negative operating margin. In the next 5 years of explicit forecast the profit margin rapidly stabilized around 10-12% indicating the ability of Latam operations to generate profits and cash, as demonstrated by EBITDA margins

Due to the burden and variability of financial expenses, Net Profits are slower to recover and less stable

Balance Sheet

The main component of Invested Capital are P.P.E., whose growth is given by purchases of right of use assets, and is constant over the explicit forecast period, consistently with a sustained revenue growth

Assuming Latam keep a relatively constant excess cash, the increase in Net Financial position is due to Total financial liabilities, whose changes are mainly driven by lease liabilities

THE TREATMENT OF WORKING CAPITAL

MAIN RATIOS (in days)	DRR	DSO	DIO	DPO
	125.8	44.5	15.9	126.3
Deferred revenues: 1) tickets sold for which the service has not yet been provided and 2) frequent flyer LATAM Pass program - related to passenger revenues Trade receivables originate mostly from Cargo segment and Corporate program. We calculated the gross value of receivables, then subtracted the expected credit loss, consistent at 7% of receivables Payables have spiked in the last two years, according to the <u>Reorganization Plan</u>: LATAM will issue convertible bonds to settle the “excessive” portion of its payables by a total of 4,561 USD million - The ratios in the table are the average annual metrics, excluding the last 2 fiscal years since they are not reliable to provide a forward-looking assessment of the main drivers of the future WC				

5. THE COST OF CAPITAL

METHODOLOGY (1/3)

CAPITAL STRUCTURE ADJUSTMENTS

- (1) With injected financial resources Latam will pay down most of its obligations, except “**Other guaranteed obligations**” which include new debt issued
- (2) By the capital increase resolved by the extraordinary shareholders' meeting of 5th July 2022, it is highly probable that Latam will cover retained losses and part of negative reserves
- (3) **Operating and Financing leases** are expected to **grow** with the gross value of Right of Use assets net of lease liabilities repayments
- (4) Latam is expected to hold an excess cash on balance sheet and repay other guaranteed debt loans
- (5) **Interest expenses** are calculated on total liabilities with pre-tax cost of debt and are included, through iterative formulas, in the Levered FCF

LATAM financial leverage has been defined as the **expected book value of net debt in 2022**, proxy of its net debt market value, **divided by the market value of equity as of 18 november 2022**. It has been assumed the ratio between the two figures will remain constant, even if the absolute value of the figures could change

METHODOLOGY (2/3)

COST OF EQUITY

BOTTOM-UP BETA ESTIMATION

- The levered beta of LATAM has been estimated with the Bottom-Up Beta approach
- First, the levered beta of each comparable has been estimated with the CAPM, regressing the monthly returns of the stock over the last five years against the returns of the S&P 500, proxy of the market portfolio
- Then, the levered beta of the comparable has been unlevered using its financial leverage computed at the last available date (3Q 2022): the unlevering has been calculated with the assumption of fixed debt with respect to the capital structure, and not fixed in currency terms
- Subsequently, the median unlevered beta of the comparables, 0.52, has been used as the LATAM unlevered beta
- At the end, the unlevered beta of LATAM has been levered with its financial leverage of 1.61, yielding a levered beta for LATAM of 1.36

EQUITY RISK PREMIUM

- The equity risk premium attributable to LATAM has been divided into two components: 1) the equity risk premium of the US stock market and 2) the country risk premium of Chile
- Assumption: LATAM risk exposure is proportional to country risk and all other market risks, measured by its beta (i.e. $\beta=\lambda$)
- To estimate the US equity risk premium, the **implied equity risk premium** of the US stock market has been regressed against the **10Y US T-bond rate** (annual data over the last 50 years)
- Given the current rate of 4.05% on a 10Y US T-bond (as of start of november 2022), the regression provides an estimate of the **US equity risk premium** of **4.48%**
- Given Chile's country risk premium of 0.99%, the **equity risk premium referable to LATAM** is **5.47%**

METHODOLOGY (3/3)

COST OF DEBT

LATAM has the following ratings:

- ❖ Moody's: B2
- ❖ S&P Global Ratings: B-
- ❖ Fitch: B-

The associated corporate default spread for a firm with the same S&P Global Rating and Fitch rating is 742.85 bps

The cost of debt pre tax of LATAM, calculated as the sum of the risk free rate and the corporate default spread of a B- rated firm, is 11.48%.

The tax rate used to compute the cost of debt after tax is Chile's marginal tax rate of 27%

The cost of debt after tax of LATAM is 8.38%

COST OF CAPITAL

$$k_e = r_f + \beta_{levered} (ERP_{US} + CRP_{CHILE}) = 11.48\%$$

$$k_d = r_f + \text{default spread}_{LATAM} = 11.48\%$$

$$\text{Capital structure} = 0.62$$

$$WACC = k_e \frac{E}{(D + E)} + k_d (1 - t_c) \frac{D}{(D + E)} = 11.48\% * 0.38 + (1 - 27\%) * 11.48\% * 0.62 = 9.57\%$$

- **Sensitivity analysis** has been implemented to get a glimpse on how the cost of capital varies according to **changes in levered beta** and **capital structure**, defined as **debt out of total capital**

- The **sky blue area** ($1.26 < \beta_{levered} < 1.46$ and $57\% < \frac{D}{D + E} < 67\%$) shows little variation

- The cost of capital estimation is not greatly influenced by an eventual bias in the estimation of the parameters, and still consistent

		Capital structure						
$\beta_{levered}$	WACC	54%	57%	59%	62%	64%	67%	69%
	1.21	9.43%	9.37%	9.31%	9.26%	9.20%	9.14%	9.08%
	1.26	9.55%	9.49%	9.42%	9.36%	9.30%	9.23%	9.17%
	1.31	9.68%	9.61%	9.54%	9.47%	9.39%	9.32%	9.25%
	1.36	9.80%	9.73%	9.65%	9.57%	9.49%	9.41%	9.34%
	1.41	9.93%	9.84%	9.76%	9.67%	9.59%	9.51%	9.42%
	1.46	10.05%	9.96%	9.87%	9.78%	9.69%	9.60%	9.51%
	1.51	10.18%	10.08%	9.98%	9.88%	9.79%	9.69%	9.59%

6. MULTIPLES VALUATION

MULTIPLES VALUATION (1/3)

MULTIPLES RATIONALE: GENERAL OVERVIEW

	<i>Latam Airlines SA⁽¹⁾</i>	<i>Industrials⁽¹⁾</i>		<i>Passenger transportation⁽¹⁾</i>	
	T12M	Median (T12M)	Mean (T12M)	Median (T12M)	Mean (T12M)
EV/Sales	1.3x	1.4x	2.3x	2.1x	1.6x
EV/EBITDA	12.3x	6.1x	-11.3x	10.1x	7.4x
P/E	N/A	7.5x	11.2x	5.7x	-0.1x
Price/Book	-0.01x	1.1x	1.9x	1.7x	1.2x

- ✗ Equity-side multiples are not useful since they are strongly biased by weak/negative results of airline companies
- ✗ EV/EBITDAR, one of the metrics used in multiples valuation for airlines, cannot be used, due to different and discretionary treatment of restructuring/rental costs
- ✗ Latam Latin America comparables faced strong challenges during and immediately after the pandemic. A sample including only these companies would result in an extremely conservative (and even illogical) valuation, given the Company's forecasts and projections

- ✓ Asset-side multiples provide useful results, even though it is necessary to take into account the bias of weak results which provide an overestimate of the trading multiples
- ✓ For this reason, NTM multiples are provided for the EV/EBITDA and EV/Sales
- ✓ Forward multiples confirm the view that (extremely high) current multiples:
 - are consistent with the fact that airlines companies are recovering from negative results, and finally manage to show positive results
 - do not provide a «steady-state» assessment

CROSS-SECTION APPROACH TO ESTIMATE EV/EBITDA MULTIPLE

In this section a cross-section of the EV/EBITDA on the TIER 1 Financials is performed

A cautious interpretation of the results is necessary due to several factors:

- Tax rate - positive expected sign: for most companies in the sample DA/EBITDA is very high and the average is 1.34
- DA/EBITDA & NET CAPEX/EBITDA - uncertain expected sign: DA/EBITDA, as mentioned above, shows extremely anomalous values, whereas the second ratio is strongly influenced by negative changes in WC
- Results are similar when excluding the third regressor: EV/EBITDA Pred. = 12.60x

$$\frac{EV}{EBITDA_{LTM}} = -10.9666 + 59.4635 * \underset{\substack{\uparrow \\ 27\%}}{Tax\ Rate} + 6.3015 * \left(\frac{DA}{EBITDA} \right) + 0.1991 * \left(\frac{NETCAPEX}{EBITDA} \right)$$

$\uparrow$
1.19
 $\uparrow$
-2.82

Beware that EV/EBITDA vary widely across firms, most of them show negative net capex and volatile reinvestment structure, the above-computed regression yield the following result:

$$Predicted \left(\frac{EV}{EBITDA_{LTM}} \right)_{LATAM} = 12.01x$$

⁽¹⁾Data downloaded 17/11/2022; any subsequent variation (present in the valuation) is specified accordingly; (Sub-)sector multiples refer to Latin American corporations

7. DISCOUNTED CASH FLOW VALUATION

DCF ASSUMPTIONS

MODEL SELECTION

I. Asset side valuation: DCF

Latam is in the process of changing its leverage: *exiting from Chapter 11, its capital structure will be relevantly adjusted, as we have described in the debt schedule, thus estimating FCFO provides less volatile value estimates respect to FCFE [1].*

$$\text{Firm Value} = \sum_{t=1}^6 \frac{FCFO_t}{(1+WACC)^t} + \sum_{t=7}^{16} \frac{FCFO_t}{(1+WACC)^t} + \frac{(1+g)FCFO_{t=16}}{(WACC-g)(1+WACC)^{16}}$$

We assume Latam will reach the **steady state** after **16 years**: we forecasted 5 year explicitly (as Business Plans were available) and 10 years of smoothed growth in free cash flow before calculating terminal value, since 2027 cash flow growth rate is far from the steady-state

III. Growth rates

Terminal cash flows growth rate g is estimated to be **2%**, in line with the market growth perspective in Latin America. **Second stage cash flow growth rate decreases from 2027 level to 2%**

IV. Free cash flow and Leases

Indirect method is applied to estimate unlevered free cash flows. According to IAS16 Latam treated lease liabilities as financial, while corresponding lease assets as operating. Consistently, we include increase in right of use assets in capital expenditure, despite being non-cash transactions as corresponding lease liabilities are recognized [2]. Adjusted free cash flow is the only-cash measure that exclude investment in lease assets

To value the company using discounted FCFO we include lease capex in order to be consistent with the target financial structure which contains lease liabilities

V. Marginal Tax Rate

Marginal tax rate is assumed to be equal to **Chilean corporate marginal tax rate**, which is **27%** [3]

VI. Operating assets

The following items are excluded from operating assets in Latam enterprise value:

- **Surplus assets**, since they are classified as held for sales
- **Other Financial assets**, which includes mainly investments in securities
- **Employees benefits**, as they are mainly investments in financial debt instruments

VII. Working Capital

- **Receivables** are estimated applying the **historical average DSO** from 2012 to 2019: due to pandemic, 2020 and 2021 cannot be considered as representative years due to their exceptional high value
- **Inventories** are estimated applying on all operating expenses except salaries, **historical average DIO** from 2017 to 2019 since previous years data are too low to be compared (6 vs 15.5)
- 2022 **Payables** are reduced respect to 2021 by USD 4,561 million as stated in the extraordinary shareholders' meeting of 5th July 2022. The reduction happens by paying creditors with Convertible bonds. *For this reason, it does not imply any cash transfer and should be subtracted to the changes in NWC to reach an only-cash change in NWC*

VIII. Capex and D&A

- In the explicit forecast period **Capex** and **D&A average annual increase** is 13%
- *In the second stage Capex is assumed to decrease up to 105% of D&A, consistently with the assumption of 2% terminal growth*

IX. Tax effect

We assume Latam has the possibility to carry forward losses indefinitely in time, resulting in immediate cash flows, rather than distribute it over time

COMPUTATIONS

MULTIPLES

$$EV_{LATAM} = \left[\frac{EV}{Sales} \right]_{comps} * Sales_{LATAM;LTM} = 1.13 * 8,590,933,000 \text{ USD} = 9,722,535,256 \text{ USD}$$

$$EV_{LATAM} = \left[\frac{EV}{EBITDA} \right]_{comps} * EBITDA_{LATAM;LTM} = 10.64 * 903,046,000 \text{ USD} = 9,604,129,170 \text{ USD}$$

DCF APPROACH – COMPUTATIONS

- The DCF is highly affected by the first year of negative FCFO, prevalently due to less revenues than expected and a high repayment of operating liabilities
- The explicit forecast is 2022E-2027F. To compute free cash flow from operations ΔWC and taxes related to the operations have been deducted from the EBITDA. Having obtained the cash generated (absorbed) from operations we deduct the CAPEX, computed according to the PPE schedule
- Since substitution in payments is not generating any cash, even if ΔWC is moving the choice is NOT to account for the variations
- In order to compute the terminal value, we used the canonical formula of a perpetuity
- Condensing the previous computations:

$$Firm Value = \sum_{t=1}^6 \frac{FCFO_t}{(1+WACC)^t} + \sum_{t=7}^{16} \frac{FCFO_t}{(1+WACC)^t} + \frac{(1+g)FCFO_{t=16}}{(WACC-g)(1+WACC)^{16}}$$

- The value obtained has then been capitalized to the WACC for 10.5 months
